

API Manager

Jitterbit Harmony API Manager

🇺🇸 English 🇧🇷 Português (Brasil)

Jitterbit Harmony API Manager

Overview

Jitterbit Harmony API Manager (API Manager) is Jitterbit's API management web interface where you can create and publish developer-friendly APIs and perform full API lifecycle management tasks. You can expose any system as a secure, managed, real-time Custom API, OData Service, or Proxy API that can be called and consumed by any other app. You can access API Manager through the [Jitterbit Harmony Portal](#).

Prerequisites

To access API Manager, you must be a member of a Jitterbit Harmony organization with a subscription to API Manager and have the appropriate organization permissions and environment access levels as described in [Jitterbit Harmony Permissions and Access](#).

As API Manager is accessed through the Harmony Portal, it does not require any additional hardware or software installation. These major browsers are supported:

- Chrome
- Firefox
- Safari (macOS only)

In order to communicate with the Harmony cloud and access the Harmony Portal, JavaScript needs to be enabled and outbound port 443 (HTTPS) needs to be open. This port is normally allowed by corporate server firewalls.

NOTE: If using [Private Agents](#), note that Linux Private Agents can accept a higher API load (more requests per minute) than Windows Private Agents on identical machines.

Resources

Documentation resources for API Manager are included in this section as follows:

- [API Manager Getting Started](#)
Information on API Manager APIs, API security, and API service URLs.
- [API Manager User Interface](#)
Documentation for each page within API Manager.
- [API Manager Configuration](#)
Instructions on configuring a security profile or a supported OAuth 2.0 identity provider.
- [API Manager How-tos](#)
Instructions on accomplishing certain tasks within API Manager.
